

# Sure-Flex Plus® Coupling Flange Types J, S, SC, B, C

Installation Instructions

P-7888-TBW

**▲ WARNING** Lock out / tag out the power source before proceeding to avoid unexpected starts. Failure to observe these precautions could result in bodily injury.

**▲ WARNING** Coupling sleeves may be thrown from the assembly with substantial force if subjected to a severe shock load.

**▲ CAUTION** Check operating speed against maximum RPM value in Table 1.

**▲ CAUTION** Rubber (EPDM / Neoprene) and Hytrel sleeves have different ratings. Do not use rubber and Hytrel sleeves interchangeably or the sleeve will fail prematurely.

## Installation / Alignment

### Installation / Alignment Tools

- Hex key set
  - [SC Spacer coupling: Socket set]
  - Torque wrench
  - Straight-edge
  - Caliper
  - Feeler gauge set
1. Inspect all coupling components and remove any protective coatings or lubricants from bores, mating surfaces and fasteners. Remove any existing burrs, etc. from the shafts. (If using a two-piece E or N sleeve, do not install the wire ring at this time.)
  2. SC Spacer couplings: using a torque wrench, bolt hubs to flanges to values in Table 2. This flange/hub combination will be referred to as “flange” in these instructions.

3. Slide one flange onto each shaft using keys where required. (When using Type B flanges, follow the instructions furnished with the Sure Grip bushings.)

4. Position the flanges on the shafts to approximately achieve the  $G_1$  dimension shown in Table 1, with an equal length of shaft extending into each flange. Note: minimum shaft engagement is  $0.85 * \text{shaft diameter}$ . Tighten set screw(s) of one flange to values in Table 2 using a torque wrench.
5. Slide back the unfastened flange and install the sleeve. The sleeve should be seated against both flanges but not compressed. When using a two-piece sleeve, do not install the wire ring yet but let it hang loosely in the groove adjacent to the teeth. Tighten set screw(s) of the second flange to values in Table 2 using a torque wrench.
6. Parallel Alignment: Without rotating the coupling, run a straight-edge around the outside of the coupling flanges – see Figure 1. Find the maximum offset with feeler gauges; this measurement must not exceed the figure shown under “Parallel” in Table 1. If necessary, realign the shafts.
7. Angular Alignment: Without rotating the coupling, run a caliper around the outside of the flange faces just inboard of the OD – see Figure 1. Set the caliper to the widest point. Find the narrowest point with the caliper and feeler gauges; this measurement must not exceed the figure given under “Angular” in Table 1. If a correction is necessary, recheck parallel alignment.

8. Tighten motor and driven equipment fasteners to manufacturer specifications; recheck parallel and angular alignment.
9. When parallel and angular alignment values are within service ratings, verify that all set screws and other fasteners are tightened to values in Table 2. Recheck parallel and angular alignment after tightening.
10. If the coupling uses a two-piece sleeve with the wire ring, move the ring into its groove in the center of the sleeve. If necessary, use soapy water and lever the ring with a wrench or blunt screwdriver.
11. Install coupling guard per applicable safety regulations.
12. Periodically check alignment, as settling can change equipment position.

**Table 1 - Maximum RPM and Allowable Misalignment**

Sleeve Size	Max RPM	G <sub>1</sub> (ref)		Type JE, JN, JES, JNS, E, N				Type H, HS, U*			
				Parallel		Angular		Parallel		Angular	
		in	mm	in	mm	in	mm	in	mm	in	mm
3	9200	1.2	30	0.010	0.25	0.035	0.89	-	-	-	-
